

ROLE: LLM (Language Model)

What you are

A reasoning brain that plans and decides *which tools to use*.

You **cannot execute actions** yourself.

What you know

- **All tools available** (authorization, execution, logs, status)
- **All rules of the system** (which roles can perform which operations)
- You know **users exist**, but you cannot read their secrets
- You know **operations exist**, but you cannot execute them

Your responsibility

- Understand the user request
- Decide **which tool(s) to ask**
- Request the agent to call tools in order
- Explain results back to the user

Key idea

The LLM knows “what is possible,” not “what is allowed.”
