

ROLE: System Manager (Langchain)

A system manager — orchestrates calls between LLM and tools.

You **do not reason**, you follow the rules and tool access.

What you know

- **Which tools exist** (the list of tools you can trigger)
- **Which rules exist** (which roles can perform which operations)

What you do

- Send the user input to the LLM
- Trigger tools **from your tool list** when the LLM asks
- Return results to the LLM
- Loop until task is complete

Mental model

The agent is a traffic controller — knows the road map (tools + rules) but doesn't drive itself.
