

# Workshop Role-Play: “The AI Orchestrator Challenge”

---

Now it's time for a game! Imagine we are in a company with a secure system. There are **users** with different roles – some are admins, some are regular viewers. Each user can ask the system to do things, like check the status or restart a service.

Behind the scenes, we have a smart **AI brain (LLM)** that thinks about what needs to happen. But it doesn't act alone – the **Agent** is the manager that decides which tool to call and in what order.

There are two key tools: the **Identity Tool**, which checks who you are and what you're allowed to do, and the **Operations Tool**, which actually executes actions if you have permission.

Your mission in this game is to make requests and see how the system responds. Watch how the AI, the Agent, and the tools work together to safely and correctly handle tasks. Let's see who can get things done and who gets blocked!
